

# A Theoretical Framework to Support Evidence Based Practice

Many attempts to implement planned change in clinical processes use models or frameworks. However, these are often loosely linked to the theory from [NR 361 Milestone 1](#) they are derived.

It is estimated that clinicians must read 19 articles a day, 365 days a year just to stay up-to-date with the steady explosion of new research in healthcare.

## NR 361 Milestone 1

The NR 361 Milestone 1 assignment requires students to prepare a PowerPoint presentation OR a Poster on an approved patient scenario. The assignment is worth 600 points. Students must meet all requirements to receive credit. This includes using scholarly references for the project and answering questions in the Course Q&A Forum.

A theory is a model that explains a set of concepts and their relationships with reference to the scholarly literature and your specific research study. Theories are [NR 451 Week 3 Healthcare Policy](#) to explain more complex phenomena that would be difficult to understand or describe without a framework.

Healthcare policies are important for medical facilities because they help them mitigate risk by ensuring that they adhere to regulatory guidelines and improve communication among staff members. They also help ensure that patients are receiving high-quality care. In addition, healthcare policy can influence health care costs and increase or decrease the quality of patient outcomes.

## NR 451 Week 3 Healthcare Policy

Healthcare policy incorporates laws set by lawmakers on a local and national level that impact issues like access to healthcare administrations. A sound health strategy depends on full and objective information from reasonably neutral sources, which can help forestall biases and allow for fair assessments of arguments.

After surveying existing information on a research topic, you must pick and articulate a framework, concepts, model or explicit theory to support your review. This will help guarantee that your decision isn't made based on personal doubts or surmises and that the theory you [NR 500 Week 5 Area of Interest PowerPoint Presentation](#) picked will be valuable in portraying your peculiarity of interest.

Nurses view the nursing concept of caring in various ways. Several nursing methods of reasoning and theories have been created to depict this concept, including Katie Eriksson's way of thinking of caritative nursing, Kari Martinsen's care reasoning, and Jean Watson's theory of caring (5). In this assignment, you will utilize qualitative technique to illuminate medical caretakers' view of the caring concept by recognizing four subjects: being, wanting, having the option to and doing.

## NR 500 Week 5 Area of Interest

In this graded threaded discussion assignment, you identify an area of interest specific to your selected specialty track. This area of interest may be a topic from the nursing literature, an observation, or an experience you have encountered in your practice. Your initial post and at least one peer response or instructor post are required to be substantive, related to the topic of your choice, and based on outside scholarly sources.

Explain the process you [NR 501 Theoretical Framework to Support Evidence based Practice](#) use to influence positive change relating to your identified area of interest. Choose two internal factors that will impact your efforts to influence positive change and describe how you plan to address these issues. Also, include a recommendation for a specific action to take related to your area of interest. All posts must be made by Wednesday, 11:59pm MT. This assignment is worth 75 points. See the discussion grading rubric for additional criteria.

## **NR 501 Week 2 Artistic Expression**

Artistic expression is the clear transformation of sensory emotional experience into an image or idea. It is a rival theory of art to over the top idealism and the arousal theory. Aside from being beautiful, artistic expression also serves as a form of communication. It allows the audience to interact with the artist and express their own thoughts and feelings about the work.

A prescriptive theory is a combination of relational statements into an organized theory that demonstrates connections among the concepts and produces testable hypotheses to guide practice (Walker & Avant 2005). In this example, physical activity guidelines are used as the concept representing the problem (lack of physical activity), intervention (music), and desired outcome of [NR 500 Week 2 Artistic Expression Caring Concept](#) health outcomes.

In the current week's graded threaded discussion, recognize an issue or worry inside your medical caretaker specialty and investigate how you would apply a chosen center range nursing theory to it. Use the PICOT format as a structure for your discourse and offer a scholarly presentation to the class by Sunday.
